

1. 已知级数 $\sum_{n=1}^{\infty} u_n$ 的前 n 项的和 $S_n = \frac{2n}{n+1}$, 求此级数的一般项, 并判别级数的收敛性.

解: $a_1 = S_1 = 2$.

$$a_n = S_n - S_{n-1} = \frac{2n}{n+1} - \frac{2(n-1)}{n} = \frac{2}{n(n+1)} = 2\left(\frac{1}{n} - \frac{1}{n+1}\right)$$

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \frac{2n}{n+1} = 2. \text{ 收敛}$$

第十章 级数
第一节 数项级数的基本概念和性质

2. 判别下列级数的敛散性, 并求出其中收敛级数的和.

$$(1) \sum_{n=1}^{\infty} \sqrt{\frac{n}{n+1}};$$

(1). $\lim_{n \rightarrow \infty} a_n = 1$, 级数发散.

$$(2) \sum_{n=1}^{\infty} (\sqrt{n+1} - \sqrt{n});$$

(2). $\lim_{n \rightarrow \infty} a_n = \frac{1}{\sqrt{n+1} + \sqrt{n}} = 0$, $\sum_{n=1}^{\infty} (\sqrt{n+1} - \sqrt{n}) = \lim_{n \rightarrow \infty} (\sqrt{n+1} - 1) = \infty$
级数发散.

$$(3) \sum_{n=1}^{\infty} \frac{1}{(2n-1)(2n+1)};$$

(3). $a_n = \left[\frac{1}{2n-1} - \frac{1}{2n+1} \right] \cdot \frac{1}{2}$

$$(4) \sum_{n=1}^{\infty} \sin \frac{n\pi}{3};$$

$\sum_{n=1}^{\infty} a_n = \frac{1}{2} \left[1 - \frac{1}{2n+1} \right] = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$, 级数收敛.

$$(5) \sum_{n=1}^{\infty} \left(\frac{n}{n+1} \right)^n;$$

(4). $\lim_{n \rightarrow \infty} \sin \frac{n\pi}{3}$ 不存在, 级数发散.

$$(6) \sum_{n=1}^{\infty} \frac{4^n + (-2)^n}{3^n};$$

(5). $\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left(1 + \frac{-1}{n+1} \right)^n = e^{-1} = \frac{1}{e}$, 级数收敛.

$$(7) \sum_{n=1}^{\infty} \frac{1}{n(n+1)(n+2)};$$

(6). $\sum_{n=1}^{\infty} \frac{4^n + (-2)^n}{3^n} = \sum_{n=1}^{\infty} \left(\frac{4}{3} \right)^n + \left(-\frac{2}{3} \right)^n$
 $\sum_{n=1}^{\infty} \left(\frac{4}{3} \right)^n$ 为发散的级数, $\sum_{n=1}^{\infty} \left(-\frac{2}{3} \right)^n = -2$ 收敛.

$$(8) \sum_{n=1}^{\infty} (-1)^n \frac{e^n}{3^n};$$

$\therefore \sum_{n=1}^{\infty} \frac{4^n + (-2)^n}{3^n}$ 发散.

$$(9) \sum_{n=1}^{\infty} \frac{n}{(n+1)!}.$$

(7). $\frac{1}{n(n+1)(n+2)} = \frac{1}{2} \left[\frac{1}{n(n+1)} - \frac{1}{(n+1)(n+2)} \right] = \frac{1}{2} \left[\frac{1}{n} - \frac{2}{n+1} + \frac{1}{n+2} \right]$
 $\therefore \sum_{n=1}^{\infty} \frac{1}{n(n+1)(n+2)} = \lim_{n \rightarrow \infty} \frac{1}{2} \left[\frac{1}{n} - \frac{1}{n+1} + \frac{1}{n+2} \right] = \frac{1}{4}$, 级数收敛.

(8) $\sum_{n=1}^{\infty} (-1)^n \frac{e^n}{3^n} = \sum_{n=1}^{\infty} \left(-\frac{e}{3} \right)^n = \frac{-\frac{e}{3}}{1 - \frac{e}{3}} = \frac{-e}{3+e} = \frac{-e}{3+e}$, 级数收敛.

$$(9). \frac{n}{(n+1)!} = \frac{1}{n!} - \frac{1}{(n+1)!}$$

$$\therefore S_n = 1 - \frac{1}{2!} + \frac{1}{2!} - \frac{1}{3!} + \frac{1}{3!} - \frac{1}{4!} + \frac{1}{4!} - \frac{1}{(n+1)!} = 1 - \frac{1}{(n+1)!}$$

$$\therefore \sum_{n=1}^{\infty} \frac{n}{(n+1)!} = \lim_{n \rightarrow \infty} S_n = 1. \text{ 级数收敛.}$$

第十章 级数
第一节 数项级数的基本概念和性质

3. 分别就 $\sum_{n=1}^{\infty} u_n$ 收敛与发散两种情况讨论下列级数的敛散性.

(1) $\sum_{n=1}^{\infty} (u_n + 0.001)$;

(2) $\sum_{n=1}^{\infty} u_{n+100}$;

(3) $\sum_{n=1}^{\infty} \frac{1}{u_n}$.

① 当 $\sum_{n=1}^{\infty} u_n$ 收敛时, $\sum_{n=1}^{\infty} u_n = S$

1) $\sum_{n=1}^{\infty} (u_n + 0.001) = \sum_{n=1}^{\infty} u_n + \sum_{n=1}^{\infty} 0.001 = S + \infty = \infty$, 级数发散.

2) $\sum_{n=1}^{\infty} u_{n+100} = \sum_{n=1}^{\infty} u_n = S$, 级数收敛.

(3) $\because \sum_{n=1}^{\infty} u_n$ 收敛, $\lim_{n \rightarrow \infty} u_n = 0$, $\lim_{n \rightarrow \infty} \frac{1}{u_n} = \infty$, $\therefore \sum_{n=1}^{\infty} \frac{1}{u_n}$ 发散.

② 当 $\sum_{n=1}^{\infty} u_n$ 发散时

1) $\sum_{n=1}^{\infty} (u_n + 0.001)$, 不确定. 例: $u_n = -0.001$ 级数收敛.

2) $\sum_{n=1}^{\infty} u_{n+100} = \sum_{n=1}^{\infty} u_n$, 级数发散.

(3) $\sum_{n=1}^{\infty} \frac{1}{u_n}$ 不确定. 例: $u_n = n$ 与 $\frac{1}{u_n} = \frac{1}{n}$, 其级数皆发散.

例: $u_n = n(n+1)$, 其级数发散.

$\frac{1}{u_n} = \frac{1}{n} - \frac{1}{n+1}$, 其级数收敛.

4. 求级数 $\sum_{n=2}^{\infty} \ln\left(1 - \frac{1}{n^2}\right)$ 的和.

$$\text{解: } u_n = \ln \frac{(n-1)(n+1)}{n^2} = \ln \frac{n-1}{n} - \ln \frac{n}{n+1}$$

$$S_n = \sum_{k=2}^n \ln \left(1 - \frac{1}{k^2}\right) = \ln \frac{n-1}{n} - \ln \frac{n}{n+1}$$

$$\sum_{n=2}^{\infty} \ln \left(1 - \frac{1}{n^2}\right) = \lim_{n \rightarrow \infty} S_n = \ln \frac{1}{2} - \ln \frac{1}{2}$$

5. 求级数 $\sum_{n=1}^{\infty} \frac{2^n}{(2^{n+1}-1)(2^n-1)}$ 的和.

解: $u_n = \frac{2^n}{(2^{n+1}-1)(2^n-1)} = \frac{1}{2^n-1} - \frac{1}{2^{n+1}-1}$

$$\therefore S_n = \sum_{k=1}^n u_k = \left(1 - \frac{1}{3} + \frac{1}{3} - \frac{1}{7} + \cdots + \frac{1}{2^n-1} - \frac{1}{2^{n+1}-1}\right) \\ = 1 - \frac{1}{2^{n+1}-1}$$

$$\therefore \sum_{n=1}^{\infty} u_n = \lim_{n \rightarrow \infty} S_n = 1$$
